Tongue Tie Before and After

How do you treat Tongue Ties?

Treatment for Muscle Attachments

With the DEKA CO₂ laser, eliminating a muscle attachment is quick, bloodless, and painless for the patient. This procedure decontaminates the area leading to decreased swelling, less post op pain, and eliminates the need for sutures.

Why is Laser Therapy the Ideal Treatment?

Laser Dentistry has proven to be one of the most exciting advancements in dental technology. Compared to traditional surgical methods, dental lasers reduce pain, swelling, bleeding, and the presence of bacteria.

"The DEKA CO₂ Laser provides our patients with a pleasant, safe and effective treatment experience."

Get the Exact Results You Want

The dentist uses a dental laser to remove the muscle attachment to release the tongue tie or frenectomy. During the quick, painless, bloodless procedures, the laser also kills bacteria which leads to faster healing with less inflammation. The DEKA CO₂ laser seals the blood vessels and nerve endings which reduce bleeding and post operative pain.

Maxillary Frenectomy

The DEKA CO₂ laser is a non-contact laser meaning there is no harsh cutting compared to traditional methods.

The DEKA CO₂ Laser

The benefits of using the DEKA CO₂ Laser include bacterial reduction and accelerated healing time. Patient discomfort is minimal and postoperative complications such as bleeding and infections are greatly reduced.

Benefits for Patients

Patients who have Laser Therapy experience:

- Faster healing and minimal bleeding
- Helps to prevent infections
- Eliminates need for sutures
